No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description

sequence 19618, Application US/09248796A
Patent No. 6747137
GENERAL INO. 6747137
APPLICANT: Keith Weinstock et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.13
CURRENT APPLICATION NUMBER: US/09/248,796A
CURRENT APPLICATION NUMBER: US 60/074,725
PRIOR FILING DATE: 1998-02-13

Patent No. 6747137;
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICANE;
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: 107196.132
CURRENT PAPLICATION NUMBER: US/09/248,796A

CURRENT FILING DATE: 1999-02-12
PRIOR FILING DATE: 1998-02-13
PRIOR FILING DATE: 1998-02-13
PRIOR FILING DATE: 1998-08-13
NUMBER OF SEQ ID NOS: 28208

                             The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and confoulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of antibodies that specifically recognize and bind to these molecules. Concert vaccines and to expand immune effector cells that are specific for cancer vaccines and to expand immune effector cells that are specific for cells characterised by expression of antigen BIF3 (melanoma antigen evaryotic initiation factor). The peptides or polypeptides conjugated to detectable agent may be used in diagnostic procedures, such as in the confection of antibodies. The polynucleotides can be used as primers for detecting genes or gene transcripts expressed in APC to confirm cranscripts and one that the confirm cranscripts into host cells The current sequence certification acid sequence must generally intitation factor 3 amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                  120

The invention relates to aiding in the diagnosis of a neoplastic condition or susceptibility to a neoplastic condition of an animal cell or tissue. The method involves determining the amount of expression of an eukaryotic translation initiation factor 3 (e1F3) protein in a test cample isolated from the cell or tissue, and diagnosing a neoplastic condition or susceptibility to a neoplastic condition based on the amount of expression of the eIF3 protein. The methods, compounds and kits are useful in therapeutics, diagnostic and screening methods for human cancer and related mallguancies, e.g. ovarian, breast, lung, colon, prostate, pancressit or gastrointestinal cancer, or melanoma. The present sequence represents the human antigen eIF3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, setoarthritis, Lober's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EVVQGVLLGLVVEDRLEITNCFPFPQHTEDDADFDEVQYQMEMMRSLRHVNIDHLHVGWY 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           QSTYYGSFVTRALLDSQFSYQHAIEESVVLIYDPIKTAQGSLSLKAYRLTPKLMEVCKEK 180

The invention relates to 971 novel human cDNA sequences (ADC29919-CC ADC3089) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nuclaic acid sequences over 99$ identical with the novel human cDNAs. The invention additionally encompasses expression the novel human cDNAs. The invention additionally encompasses expression concerns and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of polymucleotides or polypeptides of the invention; and methods of invention and invention in the distribution of the invention. The invention further discolpses methods of peventing, treating or amolorating a medical condition; kits comprising polymucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention capturession or activity of the polymucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention captures. ADC33324). The nucleic acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the captain, for assessing blodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

disease and other neurodegenerative diseases, anaemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or carcer. The nucleid caids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and confidenting immune response in a subject, and for generating cantibodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for calls characterised by expression of antigen EIF3 (melanoma antigen eukaryotic initiation factor). The peptides or polypeptides conjugated to a detection and purification of antibodies, and as immunogens for cettacting genes or gene transcripts expressed in Age to confirm confirmation of the polymucleotides can be used as primers for cetection of the polymucleotides into host cells. The current sequence confirmant cancer antigen eIF3 variant 1 amino acid sequence. Note: This sequence of the wild-type human cancer antigen eIF3 sequence artigen eIF3.
                                                                                                                                                                                                                                                                                                                                                                                                                  New therapeutic compounds useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel complex between two interacting proteins listed within the specification. The complex of the invention demonstrates anti-HIV activity whilst the SID (selected interacting domains) and polypeptides may be useful for screening molecules that inhibit human immunodeficiency virus (HIV), as well as during gene therapy procedures. The siRNAs (silencing RNAs) targeted against cellular proteins interacting with HIV-1 integrase, LEDGF, MCM7, HBO1, Shurportin, VBP1, Transportin-SR and EIPS3, are useful in preparing a medicament for treating HIV-1. The current sequence is that of the human SID protein of

compounds of the invention may be described as cytostatic and immunomodulatory. The compounds are useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of antibodies that occapies of antibodies and to expand immune effector cells that are specific for cancer vaccines and to expand immune effector cells that are specific for cells characterised by expression of antigen EIP3 (melanoma antigen of cells characterised by expression of antigen EIP3 (melanoma antigen of cells characterised by expression of antibodies or polypeptides conjugated to detection and purification of antibodies, and as immunogens for production of antibodies. The polymucleotides and as immunogens for transduction of the polymucleotides into host cells. The current sequence of the polymucleotides into host cells. The current sequence of represents the human cancer antigen eIP3 consistent in the sequence of created from the sequence of the wild-type human cancer antigen eIP3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                EVVQGVLLGLVVEDRLEITNCFPFPQHTEDDADFDEVQYQMEMMRSLRHVNIDHLHVGWY 120

The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and compounds of immunomodulatory. The compounds are useful against human ovarian cancer, compositions comprising the compounds are useful as components of anti-compositions comprising the compounds are useful as components of anti-compositions comprising the compounds are useful as components of anti-compositions comprising the compounds are useful as components of anti-compositions comprising the compounds are useful as components of anti-composition and purification of antipodies. The peptides or polypeptides conjugated to a detectable agent may be used in diagnostic procedures, such as in the correction and purification. The polynucleotides can be used as primers for detecting genes or gene transcripts expressed in APC to confirm composition of the polynucleotides into host calls. The current sequence represents the human cancer antigen elf3 variant 3 amino acid sequence.

Note: This sequence is not present in the specification, but may be considered to a prince of the wild-type human cancer antigen elf3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New therapeutic compounds useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules.

The invention relates to novel therapeutic compounds, that are designed to enhance binding to WHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and compounds are useful against human ovarian cancer, immunomodulatory. The compounds are useful against human ovarian cancer, for modulating immune response in a subject, and for generating articologies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for calls characterised by expression of antibodies by such as in the cancer vaccine and purification factor). The peptides or polypeptides conjugated to a detectable agent may be used in diagnostic procedures, such as in the detection and purification of antibodies, and as immunogens for detecting genes or gene transcripts expressed in APC to confirm transcripts expressed in APC to confirm cranscripts in the polymucleotides into host cells. The current sequence confirmant sequence is not present in the specification, but may be created from the sequence of the wild-type human cancer antigen elf3 sequence artigen in ABB08360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                              The invention relates to a novel complex between two interacting proteins listed within the specification. The complex of the invention demonstrates anti-HIV activity whilst the SID (selected interacting domains) and polypeptides may be useful for screening molecules that inhibit human immunodeficiency virus (HIV), as well as during gene procedures. The siRNAs (silencing RNAs) targeted against cellular proteins interacting with HIV-1 integrase, LEDGF, MCM7, HBO1, Snurportin, VBP1, Transportin-SR and EIF3S3, are useful in preparing a medicament for treating HIV-1. The current sequence is that of the human SID protein of

Human prostate cancer antigen protein sequence SEQ ID NO:1353.

```
Human, prostate cancer, prostate cancer antigen; detection; diagnosis; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder; wound; infectious disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antinfective, gyamecological and antibacterial activities, polynucleotides may be used for detection of prostate cancer, chromosome ldentification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polyputclecrides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens and the use of ovarian antigens, antibodies against human ovarian antigens, and the use of ovarian entigens, and the use of ovarian polymuclecrides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast related disorders. Such conditions include ovarian carrier and breast cancer, and castastatic tumours of ovarian or breast origin, reproductive system of polypeptic ovary syndrome, ovarian or pressor of pregnancy, anovulation, collocates (e.g., infertility, disorders of pregnancy, anovulation, infertility, disorders of pregnancy, anovulation, collocates, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic disorders, inferdinamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and vagnized vagnized vagnized isorders (e.g., anaemia), cardiovascular disorders (immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypeptides and polynucleotides may also be used in screening for compounds which condulate ovarian antigen polypeptides may be used as for dentification of individuals and in forensic analysis, and the dentification of individuals and in forensic analysis, and the sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed sequence date for this patent did not form part of the printed of the present of the pri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7137-ABB72072). The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 5

##4323
multidrug resistance protein sksl - fission yeast (Schizosaccharomyces pombe)
C;Species: Schizosaccharomyces pombe
C;Species: Schizosaccharomyces pombe
C;Species: Schizosaccharomyces pombe
C;Species: Schizosaccharomyces pombe
C;Accession: T43233, T38630
R;Usui, T.; Yoshida, M.; Honda, A.; Beppu, T.; Horinouchi, S.
Game 161, 33-69, 1995
A;Title: A K-25za-resistance gene, skal+, encodes a protein similar to the Caenorhabditi
